**Abstract:** The purpose of this work is to study the content of nitrate ions in the manifestation of the fire retardant effectiveness of the product of nitric acid processing of low-grade phosphorites for the fire protection of cellulose materials. To achieve the goal of this study, a method was used to study the features of the processes of processing low-grade phosphorites with solutions of nitric acid in various concentrations. To study the effect of concentration ( $\text{CHNO}_3 = 5, 10, 20\%$ ) on the solubility of samples (dust fraction (DF)), phosphorite layer-1 (FL1), phosphorite layer -2 (FL2), mineral mass (MM) low-grade phosphorites and extraction of main flame retardant components  $\Sigma$  fire retardant component experimental studies were carried out in the liquid phase. The following methods were used in the research process: chemical elemental analysis, microprobe analysis, infrared spectroscopy, potentiometry, viscometry, special methods for determining the flammability and fire protection of materials. Based on the results of studying the fire retardant effectiveness of solutions of nitrate processing of samples of low-grade phosphorites, it was discovered that all solutions exhibited fire retardant properties and increased content  $\Sigma$  fire retardant component solutions, depending on  $\text{CHNO}_3 = 5-20\%$ , a monotonous increase in the flame retardant properties of liquid phases appears ( $\Delta m, \%, -k \cdot 10$ , Fig. 3 A, B) and the most satisfactory effect ( $\Delta m, \% < 25\%$ ) is obtained when using 20%  $\text{HNO}_3$  solution. Liquid and solid phases obtained by processing with 5-20%  $\text{HNO}_3$  solutions belong to group II of fire retardant activity to ensure a decrease in the flammability of cellulose materials.

**Keywords:** Microprobe analysis, infrared spectroscopy, fire retardant component, potentiometry, viscometry, exocalcite, endocalcite.

**Introduction.** In the modern world today, through the effective use of mineral raw materials, waste from the mining and chemical industries, mineral fertilizers of particular importance for the national economy, astringents, synthetic detergents and fire retardants are obtained.

In this regard, special attention is paid to the necessary increase in their main component ( $\text{P}_2\text{O}_5$ -10-15%) through improving enrichment processes, organizing an effective process of low-temperature decarbonization, purification of fluorine-containing impurities, extraction of rare earth metals, as well as the creation and implementation of technologies for obtaining new types of inorganic products from silicate and aluminate by-products [1]. Therefore, in recent years, scientists and specialists have been engaged in scientific research aimed at creating methods and technologies for processing and obtaining materials based on these little-used raw materials to obtain inorganic materials for non-traditional purposes [2].

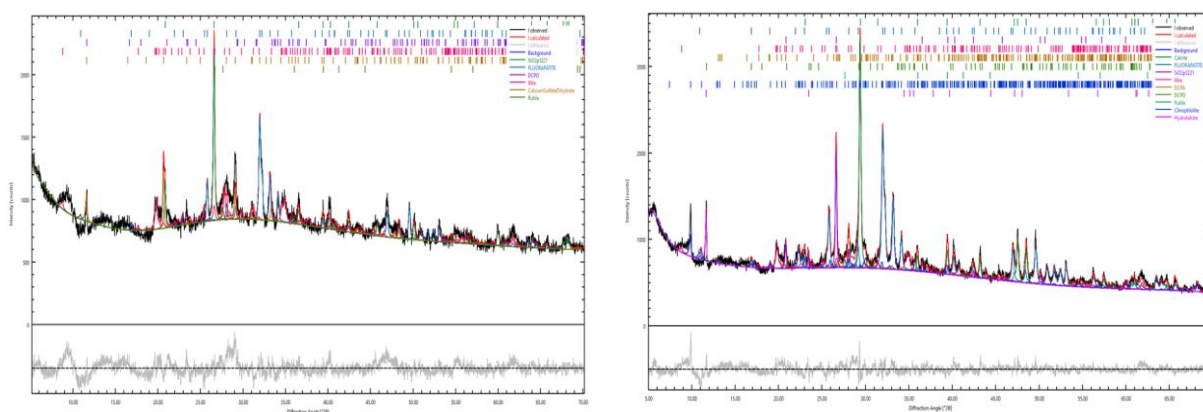

Every year, chemical industry enterprises offer new technologically advanced flame retardant formulations, but today half of the total proposed volume is inorganic compounds that have been tested for decades. These compounds include: boric acid, borax, Al and Mg hydroxides, red phosphorus, polyphosphates and ammonium sulfate [3-4].

Analysis of scientific and patent information on the use of various substances to reduce the flammability of polymer materials shows that fire retardants mainly include

inorganic and organic substances that contain in their molecules elements such as halogens, phosphorus, nitrogen, boron, metals, groups with one or another combination of their compounds, combined flame retardant composition [5].

**Methods.** The interaction of samples of low-grade phosphorites with a 5% (10 and 20%) solution of nitric acid was carried out at a ratio of S:L = 1:3, by dissolving 50 g of low-grade phosphorites in 150 ml of HNO<sub>3</sub> solution,  $\rho = 1.031 \text{ g/cm}^3$ , ( $\rho = 1.054$  and  $\rho = 1.115 \text{ g/cm}^3$ ) at 25-40 °C, for 60 minutes, pH = 2.7 (measurement carried out using a FIVE/Easy pH/mV device with a combination electrode LE438 ( $t^0=80^\circ\text{C}$ , pH = 0-14).

Studying by microprobe analysis made it possible to clarify the changes occurring from a chemical and mineralogical point of view, it can be noted that in processed samples of low-grade phosphorites, one of the common rock-forming minerals is calcite. Its content varies from 10 to 60%, the predominant share (up to 80-90%) is concentrated in the cement solid inclusion, in which microgranular calcite firmly grasps the phosphate components from the outside ("exocalcite"), as one of the forms of mixed carbonates - dolomite-calcite minerals. Another morphological variety of carbonate mineral is "endocalcite," which is found inside phosphate grains and represents relics of primary calcite. These morphological varieties of carbonates behave differently in chemical and technological processes. In Fig. 1. An X-ray pattern of samples of low-grade phosphorites processed with 20% HNO<sub>3</sub> is shown.

a) processed phosphorite layer 1      b) processed phosphorite layer 2.

**Figure 1.** X-ray diffraction pattern of a sample of low-grade phosphorites processed with 20% nitric acid:

The study of the solid phase by X-ray phase analysis (Fig. 1) showed the presence of various mineral components found in the composition of processed samples of low-grade phosphorites with nitric acid, such as in the phosphorite layer-1 sample the presence of fluorapatite Ca<sub>5</sub>(PO<sub>4</sub>)<sub>3</sub>F (34.1%); rutile - TiO<sub>2</sub> (2.4%); gypsum - CaSO<sub>4</sub> • 2H<sub>2</sub>O (9.4%);

illite - (K,Na,Ca,H<sub>3</sub>O<sup>+</sup>)(Al,Fe,Mg)<sub>2</sub>(Si<sub>3</sub>Al)O<sub>10</sub>(OH)<sub>2</sub>•(H<sub>2</sub>O,K<sup>+</sup>)(x-2) (30,8%); кварц - SiO<sub>2</sub> (23,4%).

In the phosphorite layer-2 sample the presence of hydrotalcite -  $\text{Mg}_6\text{Al}_2(\text{OH})_{16}\cdot\text{CO}_3\cdot 4\text{H}_2\text{O}$  (0,6%); rutile -  $\text{TiO}_2$  (1,3%);

clinoptilolite  $((\text{Na},\text{K},\text{Ca},\text{Mg},\text{Al})_6\text{Al}_9(\text{Si}_{29}\text{Al}_9)\text{O}_{72}\cdot 20\text{H}_2\text{O})$  (9,0%); fluorapatite  $\text{Ca}_5(\text{PO}_4)_3\text{F}$  (38,8%); quartz -  $\text{SiO}_2$  (9,9%); monetizes -  $\text{CaH}_2\text{PO}_4\cdot\text{H}_2\text{O}$  (3,7%);

illite -  $(\text{K},\text{Na},\text{Ca},\text{H}_3\text{O}^+)(\text{Al},\text{Fe},\text{Mg})_2(\text{Si}_3\text{Al})\text{O}_{10}(\text{OH})_2\cdot(\text{H}_2\text{O},\text{K}^+)(x-2)$  (16,7%); brushes -  $\text{CaHPO}_4\cdot 2\text{H}_2\text{O}$  (0,7%); calcite -  $\text{CaCO}_3$  (19,5%).

The presence of the following varieties was detected in the sample of the dust fraction: fluorapatite  $\text{Ca}_5(\text{PO}_4)_3\text{F}$  (61,4%); rutile -  $\text{TiO}_2$  (1,0%); quartz -  $\text{SiO}_2$  (5,8%); monetizes -  $\text{CaH}_2\text{PO}_4\cdot\text{H}_2\text{O}$  (13,3%);

illite -  $(\text{K},\text{Na},\text{Ca},\text{H}_3\text{O}^+)(\text{Al},\text{Fe},\text{Mg})_2(\text{Si}_3\text{Al})\text{O}_{10}(\text{OH})_2\cdot(\text{H}_2\text{O},\text{K}^+)(x-2)$  (5,4%); calcite -  $\text{CaCO}_3$  (2,8%); tribasic calcium phosphate -  $\text{Ca}_3(\text{PO}_4)_2$  (1,5%); calcium sulfate sesquihydrate -  $\text{CaSO}_4 \cdot 0.5\text{H}_2\text{O}$  (8,8%).

“Exocalcite” is easily separated from phosphate grains, since in terms of chemical activity and structural accessibility during acid decomposition, this carbonate component “exocalcite” has greater potential than “endocalcite”, which proceeds according to the reaction equation in the pH range = 6.0-4.2 in the initial stage of acid processing:

“Endocalcite” is quite strongly interconnected with phosphate components and it is impossible to separate them during washing, flotation and even roasting with sufficient selectivity without chemical intervention, which is possible at higher concentrations of  $\text{H}^+$  ( $\text{H}_3\text{O}^+$ ) acid reagent (10-20%  $\text{HNO}_3$  solution) pH=3.2-2.25, turning carbonate-fluoroapatite into hydrofluoroapatite [6-7].

“Endocalcite” is quite strongly interconnected with phosphate components and it is impossible to separate them during washing, flotation and even roasting with sufficient selectivity without chemical intervention, which is possible at higher concentrations of  $\text{H}^+$  ( $\text{H}_3\text{O}^+$ ) acid reagent (10-20%  $\text{HNO}_3$  solution) pH = 3.2 - 2.25, turning carbonate-fluoroapatite into hydrofluoroapatite:

At the same time, the carbonate and phosphate components in all types of processed samples of low-grade phosphorites are subject to maximum decomposition.

**Results.** The interaction of nitric acid with samples of low-grade phosphorites occurs through the decomposition of carbonate components (according to equation 1). To prove these statements, we present data from an IR spectral study of one of the samples of low-grade phosphorites - the dust fraction, since similar patterns were also found in the spectra of other phosphorite samples (Fig. 2. IR spectra).

Judging by the spectra, it should be noted that the decarbonization of the phosphorite sample does not proceed until the complete decomposition of the carbonates, as evidenced by the presence of a band in the IR spectrum with frequencies of 1456.26, 1417.68  $\text{cm}^{-1}$   $\text{vas}(\text{CO}_3)$ , 871.82  $\text{cm}^{-1}$  (weak), 711.43  $\text{cm}^{-1}$  (very weak) bands characteristic of dolomite-calcite (mixed) carbonates in the composition of the nitric acid processed sample (Fig. 2.) [8-9]. Apparently, these carbonates are part of the

“endocalcite” forms, deeply penetrating into the internal pores of the crystalline forms of the phosphorite components, to which the particles ( $H_3O^+$ ) of the acid-decomposing reagent cannot “reach”. S:L

Further increase in the amount (up to S:L=1:3) of more concentrated solutions of nitric acid with a decrease in the pH of the liquid phase to 1.88 (10% solution) and 1.75 (20% solution), in addition to the above, promotes the following transformations, accompanied by complete decomposition of carbonate components, incomplete decomposition of fluorapatites and partial decomposition of silicate rocks of phosphorite. The latter is due to the decomposition of  $CaF_2(s)$  upon reaching  $pH < 2.0$  and the formation of HF in the reaction medium [10-11].

Under the influence of nitric acid, silicate and phosphate components also undergo partial decomposition, as evidenced by the data of the IR spectra (Fig. 2), in which a slight decrease in intensity and low-frequency mixing (by 3.8  $cm^{-1}$ ) were detected bands mutually overlapped  $\nu_{as}(SiO)$  and  $\nu(PO)$  at 1028.06 and a reduction in the number of bands from 9 to 3 in the low frequency region: 601.7, 567.07 and 433.48  $cm^{-1}$ , related to bending vibrations of the O-Si-O, M-Si-O and Si-O-Si bonds in silicate tetrahedra [8-9].

**Figure 2.** IR spectra of the atomic acid processed sample of the dust fraction:  
a) 400-4000  $cm^{-1}$  и b) 400-800  $cm^{-1}$

Absorption bands characteristic of phosphate groups, the main component of phosphorite  $\nu_{as}(P=O)$ ,  $\nu_{as}(P-O)$ ,  $\nu(PO)$  groups were not detected as separate spectrally

identifying bands, which is a consequence of the overlap of these bands with a wide intense band in the range  $900-1100\text{ cm}^{-1}$ . Evidence of the presence of phosphate components is the presence of reflection peaks at 32.09 and 32.14, characteristic of hydrated phosphates in the diffraction patterns in figure. 2. [12].

The resulting suspension after processing was left to settle and mature for 120 minutes, after which it was separated into liquid and solid phases by filtration. The liquid phase was analyzed for the content of dissolved components (Table 1).

The solid phases were dried in air and in an oven at  $110\text{ }^{\circ}\text{C}$  for 45 minutes, the compositions were analyzed (Table 2) and used to study the flame retardant properties according to the methods of [13-14]. The results of the chemical analysis of the resulting solutions and solid samples of nitrate processing are reflected in tables 1 and 2.

**Discussions.** The results of the analyzes are presented in tables 1 and 2. A more detailed examination made it possible to note that the total content of the main flame retardant components  $\Sigma_{FRC}$  ( $P_2O_5, SiO_2, Al_2O_3, Fe_2O_3$ ), extracted into the liquid phase by processing samples of the dust fraction with a 5% solution of nitric acid, phosphorite layer-1, phosphorite layer-2 are 7.34-7.47% and are close to each other, and for a mineral mass sample this figure is 1.163 times lower (6.42%) compared to the above samples of low-grade phosphorites.

An increase in the concentration of  $HNO_3$  to 10% leads to an increase in the total solubility of low-grade phosphorite samples to an average of 34.0% and the content of fire retardant components to 16.25% for three varieties (dust fraction, phosphorite formation-1, phosphorite formation-2) and some underestimation of 14.21 and 30.40% (1.143 times), respectively, extraction for the mineral mass was found.

1-Change in solubility; 2 - Changing  $\Sigma$  the flame retardant composition of the liquid phase; 3 - Changing the pH of the environment

B – Dependence of changes in the solid phase content of low-grade phosphorite on  $CHNO_3, \%$ :

1- Change in solids content; 2 – change in the flame retardant composition in the solid phase; 3 - Changing the pH of the environment

**Figure 3.** A – Dependence of the solubility of low-grade phosphorites on  $CHNO_3, \%$ .

The content of additional nitrogen-containing component ( $NO_3^-$  ions) in all obtained liquid phases of processed samples of low-grade phosphorites are very close to each other (5.64-5.87%) and 2.4 times higher compared to those in 5%  $HNO_3$  solutions.

Similar indicators in the liquid phases obtained by processing samples of low-grade phosphorites with a 20% solution of  $\text{HNO}_3$  have an average value of 24.04 ( $\Sigma\text{FRC}$ ) and 43.30% of total solubility, which is 1.48 and 1.274 times more than in the case of a 10% solution of nitric acid. Although in this case there is an increase in the extraction of components into the solution with an increase in the content of the acidic reagent, it should be noted that the specific solubility is lower relative to the increase in concentration, than in the case of an increase in the concentration of  $\text{HNO}_3$  in the range from 5% to 10% solution (3.24, 3.02 and 2.03, respectively), which may be associated with a change in the rheological characteristics, the hydrodynamic characteristics of the formed pulps and their liquid phases.

A comparison of the data obtained on the extraction of soluble components under the influence of  $\text{HNO}_3$  indicates the greatest suitability (acceptability) of a solution of this reagent with a 10-20% concentration for processing the studied samples of low-grade phosphorites in order to obtain fire retardant compositions based on them.

**Conclusion.** Based on the study, the following conclusions of theoretical and practical significance were presented:

It has been proven by fire tests that composite phosphate fire retardant compositions obtained from solid products of acid processing of low-grade phosphorites exhibit fire retardant effectiveness, exhibiting group II fire protection of wood materials. Samples of the solid phase were used as filler-additives in the composition of fire retardant agents applied to the surface of wood materials, thereby, based on the solid phase, a fire retardant composition for the fire protection of wood materials was obtained. According to the test results, it was found that the wood material lost 12.6% of its mass (the fire retardant effect was 87.4%). Samples treated with all fire retardants become charred and smoke without ignition.

Based on the results of studying the fire retardant effectiveness of solutions obtained by processing with 5 and 10% solutions of nitric acid, it was revealed that there was no sufficient degree of fire protection relative to the established criterion (<25%).

Liquid phases obtained by processing with 20%  $\text{HNO}_3$  solutions belong to group II of fire retardant activity to ensure a decrease in the flammability of cellulose materials.

Theoretical basis of technological parameters of the new pneumo-mechanical gin machine	
<b>Bakhritdinov B.</b>	<b>33</b>
Increase production volume by regeneration of cotton	
<b>Otamirzayev A.</b>	<b>38</b>
Measures to dangermine during the initial processing of cotton	
<b>Kamolova M., Abdukarimova M., Mahsudov Sh.</b>	<b>42</b>
Measures to dangermine during the initial processing of cotton	
<b>Shogofurov Sh., Jurabayev N., Xolikov K.</b>	<b>55</b>
Analysis of the technology of obtaining knitted fabrics with patterns and their physical and mechanical properties	
<b>Jurabayev N., Shogofurov Sh., Yusupov S.</b>	<b>64</b>
Study of the physical and mechanical properties of hosiery products made from bamboo yarn	

## TECHNICAL SCIENCES: AGRICULTURE AND FOOD TECHNOLOGIES

<b>Nasriddinov B., Serkaev Q., Yo'ldiev A.</b>	<b>70</b>
Effect of solvent compositions on oil indicators in cotton oil extraction	
<b>Yulchiev A., Yuldashev Sh.</b>	<b>79</b>
Economic efficiency in the production of cream-perfumed soap	
<b>Ikromova Y., Ikromov F., Khamdamov A., Xudayberdiyev A.</b>	<b>85</b>
Modeling of primary distillation process of vegetable oil miccella	
<b>Ismailov M., Adashev B.</b>	<b>92</b>
Prevention of external flood formation on the surface of heat exchanger pipes	

## CHEMICAL SCIENCES

<b>Tajibayeva N., Ergashev O.</b>	<b>99</b>
Nanofibers based on chitosan and synthetic polymers: a review of properties and applications	

<b>Kuchkarova D., Soliyev M., Ergashev O.</b>	
Quantitative determination of adsorption activity of adsorbents obtained on the basis of cotton stalk and cotton boll	<b>104</b>
<b>Abdullaxanova G., Ergashev O.</b>	
Differential heat and entropy of adsorption of methanethiol in sodalite	<b>112</b>
<b>Paygamova M., Khamzakhojaye A., Ochilov A., Paygamov R.</b>	
Physicochemical properties of carbon adsorbents derived from renewable biomass	<b>121</b>
<b>Kochkarova R.</b>	
Use of electron spectra in determining the coordination number of central atoms of complex compounds based on Ni(II) and Co(II) ions	<b>131</b>
<b>Yusupova M., Mamadjonova M., Egamberdiev S., Abduvohidov I.</b>	
Study of the conditions for the aminolysis of secondary polycarbonate	<b>136</b>
<b>Ikramova G., Askarova O., Siddikov D., Karimov A., Botirov E.</b>	
Chemical components of perovskia kudrjashevii	<b>142</b>
<b>Kaxarova M., Soliyev M.</b>	
Types of plant growth regulators and their application in agriculture	<b>147</b>
<b>Juraboev F.</b>	
Investigation of the synthesis of acetylene amino alcohols and the study of their biological activity	<b>151</b>
<b>Salikhanova D., Usmonova Z.</b>	
Thermal activation of plums	<b>155</b>
<b>Kadirxanov J., Urinov A.</b>	
Development of composite materials for corrosion protection of main gas and oil pipelines with increased chemical adhesion	<b>160</b>
<b>Sotiboldiev B.</b>	
Synthesis of hybrid composites of polysaccharides based on methyltrimethoxysilane	<b>167</b>
<b>Jumayeva D., Nomonova Z.</b>	
Chemical characterization of raw materials used for adsorbent production	<b>174</b>
<b>Muratova M.</b>	
Method for producing a fire retardant agent with nitric acid solutions of various concentrations	<b>183</b>
<b>Shamuratova M., Abdikamalova A., Eshmetov I.</b>	
Physicochemical properties and results of sem analysis of soils in the regions of Karakalpakstan	<b>192</b>
<b>Dadakhonova G., Soliev M., Nurmonov S.</b>	
Composition of oil products and methods of separation of individual substances	<b>199</b>

<b>Hoshimov F., Bektemirov A., Ergashev O.</b>	<b>206</b>
Effectiveness of the drug "Akaragold 72%" against cotton spider mites	
<b>Abdirashidov D., Turaev Kh., Tajiyeu P.</b>	<b>213</b>
Analysis of the physicochemical properties of polyvinyl chloride and the importance of mineral fillers in increasing its fire resistance	

## TECHNICAL SCIENCES: MECHANICS AND MECHANICAL ENGINEERING

<b>Makhmudjonov M., Muminov Kh., Tilavkhanova L.</b>	<b>219</b>
Classification and analysis of level measurement methods	
<b>Mukhammadjanov M.</b>	<b>226</b>
Digital modeling of the heat transfer process in oil power transformers in operation	
<b>Mukhtorov D.</b>	<b>230</b>
Investigation of drying efficiency in a solar installation with composite polyethylene film depending on the product thickness	
<b>Tursunov A., Shodmanov J.</b>	<b>239</b>
Advancing sustainable environmental strategies in the cotton industry through dust emission reduction	
<b>Saidov O.</b>	<b>247</b>
Event-driven process orchestration in e-governance: modeling asynchronous integration patterns	
<b>Obidov A., Mamajanov Sh.</b>	<b>252</b>
Organization of scientific and research processes based on information and digital technologies in higher education	
<b>Turdaliyev V., Akbarov A., Toychieva M.</b>	<b>259</b>
Theoretical study of the vibration of chain networks	
<b>Abdusattarov B., Xamidov S.</b>	<b>265</b>
Modeling the process of separating cotton particles from air in the working chamber of a cotton gin	
<b>Toirov O., Amirov S., Khalikov S.</b>	<b>272</b>
Diagnostics of the condition of elements of electric power supply substation	

## ADVANCED PEDAGOGICAL TECHNOLOGIES IN EDUCATION

<b>Mukhtorov D., Jamoldinov K.</b>	<b>281</b>
Development and improvement of drying technologies in a solar dryer	
<b>Uzokov F.</b>	<b>291</b>
Graphical solution of systems of equations in two-and three-dimensional spaces using MS excel
